Let MWEM(**A**): repeat until happy …

   1. Use the exp mech to pick a **q** in **Q** "maximizing"

$$\textbf{score}(\textbf{A}, \textbf{q}) = | \, \textbf{q}(\textbf{A}) - \textbf{q}(\textbf{D}) \, |.$$

   2. Use the Laplace mech to measure **q**(**A**) + noise.
   3. Update guess about distribution **D**, using MW.

"Theorem": each step decreases KL(A || D) by | error |.

"Practice": after few questions, most are pretty accurate.

Let MWEM(**A**): repeat until happy ...

   1. Use the exp mech to pick a **q** in **Q** "maximizing"

$$\textbf{score}(\textbf{A}, \textbf{q}) = |\, \textbf{q}(\textbf{A}) - \textbf{q}(\textbf{D})\,|.$$

   2. Use the Laplace mech to measure **q**(**A**) + noise.
   3. Update guess about distribution **D**, using MW.

"Theorem": each step decreases KL(A ll D) by l error l.

"Practice": after few questions, most are pretty accurate.
